

Shadow Shell

Windows services, to some extent, have to support a good number of machines. In this application, I'll teach you how to create your own Windows service in C#, deploy it, configure it for remote execution and run it in background without waiting on the Windows shutdown.

Overview: The service is available in two editions: a basic edition with a wizard-like installer and an advanced edition with a custom configuration. The basic edition is more straightforward and it allows you to use it as a service just by calling [StartService](). The advanced edition is more powerful and it allows you to customize a Windows service by yourself. In this article, we will demonstrate how to use the advanced edition. To follow this tutorial, you must have basic knowledge of .NET, preferably using Visual Studio. As a nice add-on, you will also learn how to use PEX in this tutorial to learn more about the service at system level. Basic information on how a Windows service works can be found at Introduction: [Windows services](). They are the most commonly used way to deploy background applications. They are very easy to use: you simply create a setup file that contains the .exe for the application, and you have to set the permissions and the user for your service. They have several advantages: - no software installation is required - the service will be installed at Windows boot and will run in background, even if the computer is not on. - there are some limitations on the number of simultaneous instances and the number of users, but this is not a problem for most applications. - they are managed by Windows itself. In this tutorial, we will create a Windows service in C#. Creating a Windows service: Let's begin by creating a Windows service, it will look like this: Let's create the service:

What's New In?

Shadow Shell is a professional application designed to ease the process of deploying Windows services. Using it, you will be able to call your own app as a service, as well as to customize a C# service by yourself. The principle it relies on is that the service will be started at Windows boot, while background instances are periodically created provided that the OS is running. Shadow Shell Version History: Shadow Shell Version History: 1.0.1.0.0 - 22/07/2015 - "Notification of development changes" 1.0.1.0.0 - 22/07/2015 - "Notification of development changes" Notes: Bugs: 1.0.0.0.0 - 20/07/2015 - "Initial Version" 1.0.0.0.0 - 20/07/2015 - "Initial Version" Known Bugs: 1.0.0.0.0 - 20/07/2015 - "Notification of development changes" This page has been auto-generated Please do not edit this page directly, instead please use the api.csdn.net editor to make changes to the [csdn.csdn.net](https://www.csdn.net) site.
