There are lots of other Lightroom 5 features, of course. However, when I look at the total effects of improvements made to Lightroom, these two continue to top the list of important new features. Now, this article is about Lightroom, so let me start it off by praising this fine piece of software. Adobe did a fine job of making Lightroom 5 more suitable and easy to use in the post-Photoshop CS6 era. It now has a much more modern UI. I feel that the user interface has been around for enough time now that this update really does feel like the biggest update in years. Adobe has removed the dreaded presets, the app is much quieter without any unnecessary animations and it's so much faster. The biggest and best part is that it's much easier to get started and to use. For me, that's the one aspect that has seen the biggest improvement. This is sorely needed after the heavily advertised "revolution" from CS6. Adobe also made it easier to share photos and videos from Lightroom to other applications, as well as easily creating their own. All in all, I feel like Lightroom 5 may be a turning point for this software. They have also added a good amount of new content to the library. What's more, it will be easy to get more - Lightroom CC is available as an update. Lightroom 5 is a far better shot at Retouche's RAW workflow than 5.x was. Adobe took the improvements in CS6 and expanded on it. You can use Adobe Camera RAW without a problem if you are a user of Lightroom. In fact, there are certain features that work significantly better than in Lightroom - namely, the tools such as adjustments, filters and brushes. You still can't perform most of these things directly on the image, but the image is linked to a separate file so you have the strength of Lightroom's cataloging system, all while saving a ton of time.

Adobe has confirmed that AI and machine learning are expected to drive a big part of the future of image editing, and it's no surprise that new approaches to machine learning are being applied to broaden the reach of Photoshop, and make it possible to do more on larger files. With Sensei, the idea is to put a new focus on smarter photo workflows and the ability to get to the right kind of information and appropriate image data without having to sift through the voluminous data available to the Photoshop user. Yet, even as has been the case in much of the early work on AI and machine learning, we don't know what Adobe will have in store for us, and whether the company will reveal other kinds of AI advancements that support the wider set of creative needs in the future. Part of the fun of the Photoshop world is to explore possibilities and scenarios and see where the new AI features can feed back in to the existing workflow and help it innovate in new ways. It's a question of how to best leverage the more advanced AI insights gained by the more powerful toolsets. Photoshop is actually the second Adobe photo product to embrace the new power of the GPU-accelerated APIs and advent of the new Mac operating systems. The premier digital photography product, Lightroom , has already had the benefit of ex-Photoshop APIs in some of its previous versions. Its latest version, Lightroom 2020, has an interface that looks almost identical to Photoshop. However, Lightroom has not had the benefit of other advanced features that have been developed for other Adobe applications, including the ability to harness GPU-accelerated APIs for the creation of 3D content. Also, Lightroom works with the more stable native APIs on both macOS Catalina and Mojave.
